TEST FIRE AT SEA

BASIC RISK ASSESSMENT GUIDE FOR ALL PERSONNEL

Seagull prohibits test firing by default. It only takes place under GCD written authorisation after a Master makes a formal written request and signs SM/OPS/FORM/018 accepting responsibility and indemnity. This guide covers the main hazards you will face during an authorised test fire at sea. Read it before you brief your team and before you fire. If you are unsure about anything, contact the GCD before firing.

#	HAZARD	WHAT CAN HAPPEN	WHAT YOU DO
1	**Negligent discharge**	Weapon fires unintentionally while loading, handling, or aiming. Serious or fatal injury to firer, TL, or bystander.	✓ Apply NSPs every time a weapon is handled ✓ Muzzle down, trigger finger straight, safety ON until ready to fire ✓ Do not load until TL gives the direct order to commence ✓ TL observes every weapon handling movement from make-ready to make-safe
2	**Ricochet — water or hard surface**	Round bounces off sea surface or vessel structure. Unpredictable direction, injury to crew, vessel damage, or strike to other shipping.	✓ Aim downrange at water only, with clear view beyond ✓ Never fire toward hard surfaces (containers, hull, bulkheads, equipment) ✓ Confirm 5nm clear bubble before firing — no other vessel in range ✓ Angle of fire low and away from superstructure
3	**Unintended strike — persons, vessel, aircraft**	Round hits crew member, Seagull personnel, vessel fitting, another vessel, or low aircraft. Fatal or serious injury; criminal liability.	✓ Full position/environment check on FORM/018 Section 3 before firing ✓ Visual scan 360° immediately before each shot; abort if anything enters view ✓ Crew kept clear of firing area — no exceptions ✓ TL retains abort authority and uses it
4	**Hearing and eye damage**	Muzzle blast and ejected cases cause permanent hearing loss, tinnitus, or eye injury to firer, TL, and any observer.	✓ Hearing protection worn by firer, TL, and anyone in firing zone ✓ Eye protection worn by firer and TL without exception ✓ Observers positioned well clear and behind the firing line
5	**Weapon malfunction or stoppage**	Round jams, misfires, or hang-fires mid-sequence. Risk of unintended discharge when clearing; panic handling causes further injury.	✓ Wait the full procedural delay before clearing a misfire ✓ Muzzle stays pointed downrange during any stoppage drill ✓ Only the firer handles the weapon during clearance; TL supervises, does not take over ✓ If cannot be cleared safely, make-safe and abort the evolution
6	**Ammunition discrepancy**	Rounds issued do not match rounds fired plus rounds remaining. Missing ammunition is a serious breach — theft, loss overboard, or miscount.	✓ Issue rounds one-by-one from magazine, record on FORM/019 ✓ Collect spent cases and count after firing ✓ Rounds reconciled before weapons return to armoury ✓ Any discrepancy — stop, narrate on FORM/019, Safety App report, GCD notified
7	**Recoil injury**	Firer loses control of weapon due to recoil, sea state, or poor stance. Dropped weapon, muzzle sweep, injury.	✓ Confirm firer is FCC-current and familiar with weapon type ✓ Stable stance, sling properly fitted, weapon supported correctly ✓ Sea state must permit safe shooting position — TL aborts if motion excessive ✓ Single shot only — no burst, no semi-auto magazine dumps
8	**Geographic exclusion breach**	Firing in prohibited sea area (Yemeni coast, Somali coast, IRGC patrolled, territorial waters, near warship). Diplomatic incident, coalition response, vessel detention.	✓ TL confirms position against all ten geographic exclusions on FORM/018 Section 3 ✓ Any exclusion active = abort ✓ Not optional — cannot be waived by TL, Master, or Operations ✓ Do NOT fire near or along the Yemeni coastline — sound of weapons fire can trigger response

9	**Crew / Master interference**	Master, crew, or bystander attempts to handle, hold, pose with, or approach a weapon. Theft attempt, negligent discharge, reputational disaster.	✓ Master's signed FORM/018 binds him to crew no-contact direction ✓ TL always maintains immediate control of weapons ✓ Firing area kept clear of all non-Seagull personnel ✓ Any handling attempt — abort immediately, secure weapons, report via Safety App and to GCD
10	**Authorisation breach — no GCD sign-off**	TL pressured by Master or Operations to proceed without written GCD authorisation. Personal liability; company liability; criminal exposure.	✓ TL does not fire without written GCD authorisation and signed FORM/018 ✓ No verbal authorisation is valid ✓ If pressure applied, escalate to GCD directly — bypass Operations if needed ✓ The TL carries final authority to decline or abort. Use it.

STOP WORK – YOU HAVE THE RIGHT

If you believe the evolution is not safe — no GCD authorisation, Master refuses to sign FORM/018, geographic exclusion active, crew interfering, weapon malfunction, weather worsening, or any other concern — you DO NOT FIRE.

Abort the operation, make weapons safe, notify Ops and the GCD, and submit a Safety App report at report.seagullmaritimeltd.com. No Master, client, or Operations instruction overrides your authority to abort.

No one will be punished for refusing an unsafe operation. Tell your Team Leader. If they do not listen, contact the Group Compliance Director directly.
